

## Donaghys Copper Chelate

Donaghys Copper Chelate concentrate is a liquid mineral supplement for cattle, sheep and deer. Copper is required for many essential enzymes and reduces the risk of poor fertility, ill thrift and lameness while improving disease resistance. Copper Chelate is suitable for the prevention of copper deficiency including that caused by the treatment of facial eczema with high levels of zinc.

- Should be used where a copper deficiency has been identified through animal testing or sampling of feed.
- Donaghys Copper Chelate concentrate can be used in conjunction with high levels of zinc supplementation (for facial eczema) or with high iron content water.
- Should be given at times when livestock is consuming feed which is deficient in copper (such as straw) or pasture on copper deficient soils.
- Donaghys Copper Chelate concentrate contains 70mg/ml of elemental copper in an organically bound form.
- Donaghys Copper Chelate concentrate is in liquid form and is ready to use.
- Care should be taken not to oversupply copper as high levels of copper can be toxic to livestock (caution is recommended when supplementary feeding with PKE)
- Particular care should be taken with sheep when supplementing with copper

### DIRECTIONS FOR USE:

- Dose rate is a maximum of:  
6ml per cow per day.  
0.3ml per adult sheep per day.  
2.5ml per adult deer per day, through the water supply.
